Pretoria - [Blue Tinted Lens](#) for Low Floor Light Housings

Pretoria Transit Interiors, Inc. the market leader and innovator of Passenger Interior Lighting systems is pleased to announce the availability of Blue Tinted Lens. Blue tinted lens provide a safer means of reducing window and windshield glare than the normal tinted lamp tube shields.

Pretoria Blue Tinted Lens is constructed of the same polycarbonate resin that we use for our clear lens, only that they are pigmented with a light-stable blue pigment.

The use of our blue tinted lens will eliminate the need for colored lamp shields which have inherent problems such as:

- 1) Lamp tube shields which are cut too long can come in direct contact with the socket receptacles. During the normal expansion of the polycarbonate tube shields during warm periods, the lamp tube shields can push the socket receptacles away from the lamps ends. This action will cause arcing at the lamp ends and sockets, resulting in an elevated temperature at the lamp ends. Leading the way to pre-mature lamp life or worse.
- 2) When the colored lamp tube shields are cut too short they can slide on the lamp tube leaving one or both ends of the lamp tube uncovered.

The Pretoria blue tinted lens is designed to fit securely into the Pretoria Low Floor light housings. Whether it is new bus construction or retrofit, our new Blue Tinted Lens will improve the safety and appearance of your interiors.
